

# How to Lower the Door on a 48 Inch **omnivan**<sup>®</sup>

1. Locate the lower omniprop bracket

2. Remove the nut and omniprop

3. Remove upper screw; Loosen lower; Rotate the bracket

4. Drill lower hole; Install screw; Use SOAP or WAX on screw.

5. Replace omniprop and nut. You are done.

You will need to have someone help you (or have a pole to hold the door up) when you pull the omniprop off the lower bracket. The screw is very tight in the hole so using WAX or SOAP to lubricate the screw will help. There is enough slack in the connections to allow the lower end of the omniprop to be removed without removing the upper nut.
